noon app UI skill

Claude skills plus a React kit of the noon app. Describe a page in Claude Code; get a clickable flow in the app's own design, data and motion.

/noon-ui · 11 screen skills · 20 flows · npm i noon-kit

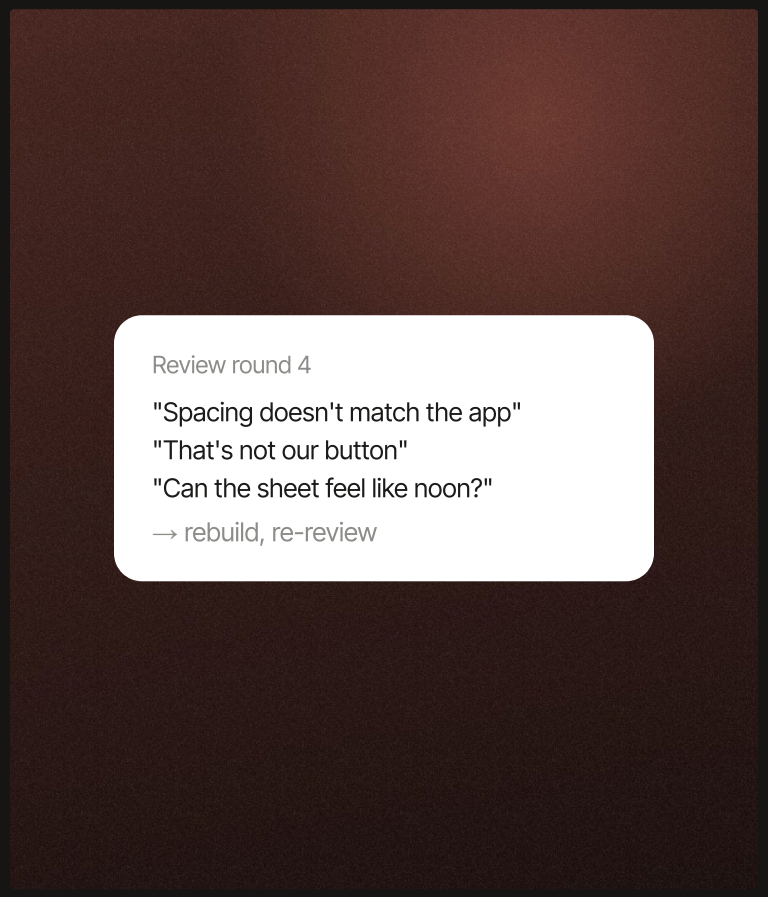

Every prototype starts from zero, and drifts

Each new idea means rebuilding screens that already exist in the app, then a long refine loop before the actual feature gets any time.

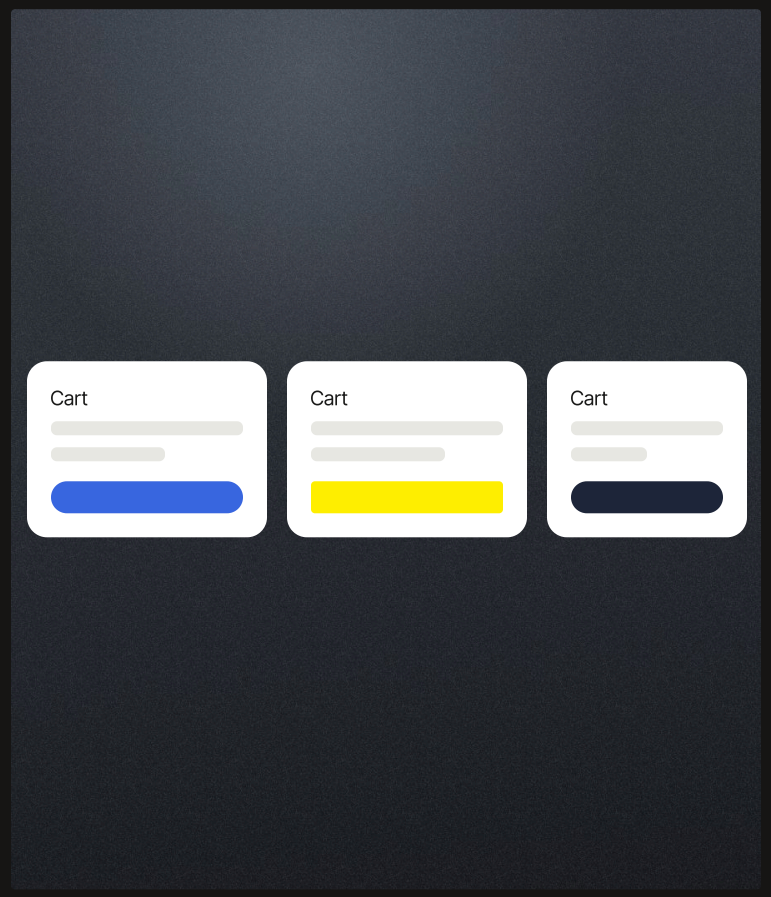

Built from scratch

Headers, cards, carts and data rebuilt for every prototype.

Refine, rebuild, repeat

Rounds of fixes to look like noon before the feature gets reviewed.

Every page looks different

Three prototypes, three buttons, three spacings. Nothing lines up.

Pick one way in

Git if you build and change flows in the kit itself. **npm** if you want the noon screens inside your own React app. Both get the Claude skills.

A The Git way

Build new pages in the kit repo with Claude.

1 **Clone and install**

```
git clone https://github.com/arnabdebnath07/noon-app-skill.git
cd noon-app-skill && npm install
```

2 **Run the preview**

```
npm run dev            # → localhost:5180/homepage
```

3 **Open Claude Code in the folder** the skills load by themselves

```
claude
```

4 **Ask for a page**

```
/noon-ui build a loyalty hub with points and rewards
```

B The npm way

Use the kit in another React 19 app, skills from the plugin.

1 **Add the skills to Claude Code**

```
claude plugin marketplace add arnabdebnath07/noon-app-skill
claude plugin install noon-ui@noon-flow-kit
```

2 **Install the package** noon-kit on npm · React 19

```
npm i noon-kit react react-dom
```

3 **Render the flows**

```
import { NoonPrototype, homeFlow, pdpFlow, cartFlow }
  from 'noon-kit';
import 'noon-kit/style.css';

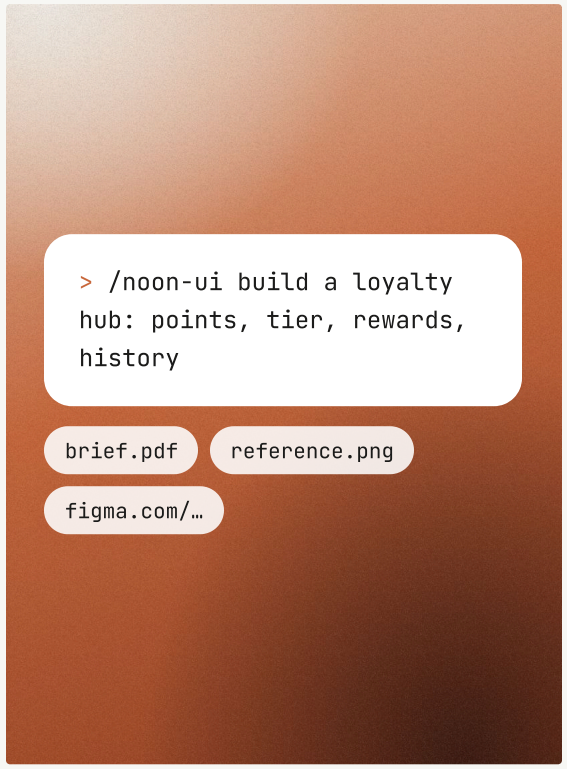

<NoonPrototype flows={[homeFlow, pdpFlow, cartFlow]}
  initialRoute="home/home" />
```

BOTH · OPTIONAL

Connect Mobbin for research: `claude mcp add --transport http mobbin https://api.mobbin.com/mcp` then `/mcp` → mobbin → Authenticate

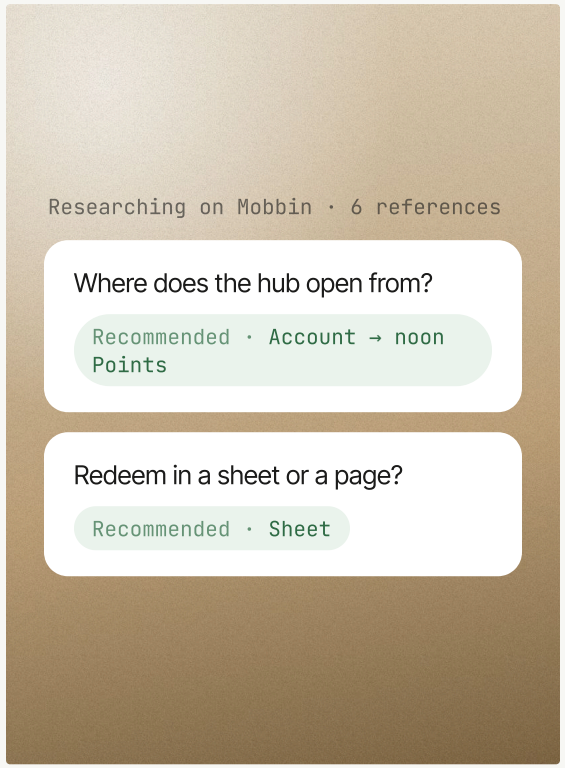

Ask, answer, review, refine

Four moves in Claude Code. Start with a screen skill such as **/pdp** or **/cart**, or **/noon-ui** for anything new.

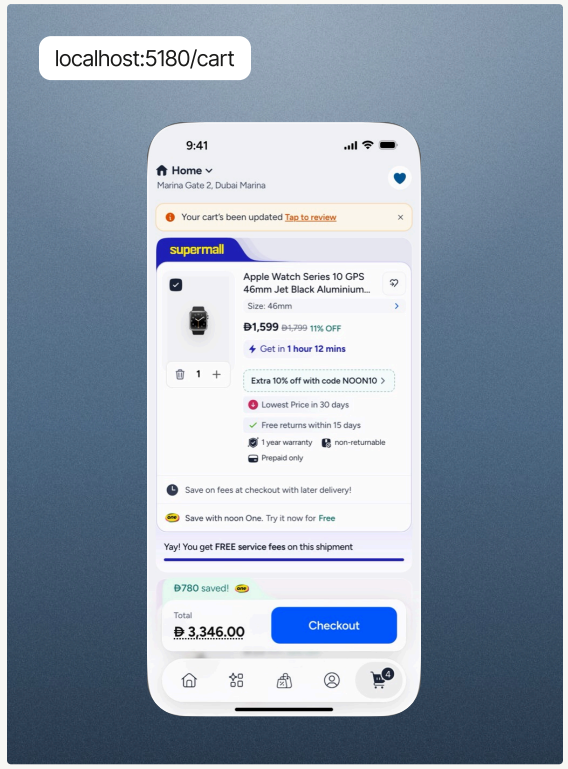

01 Ask

Say what the page is and what the user does there. Attach a screenshot, Figma link or `@file` if you have one.

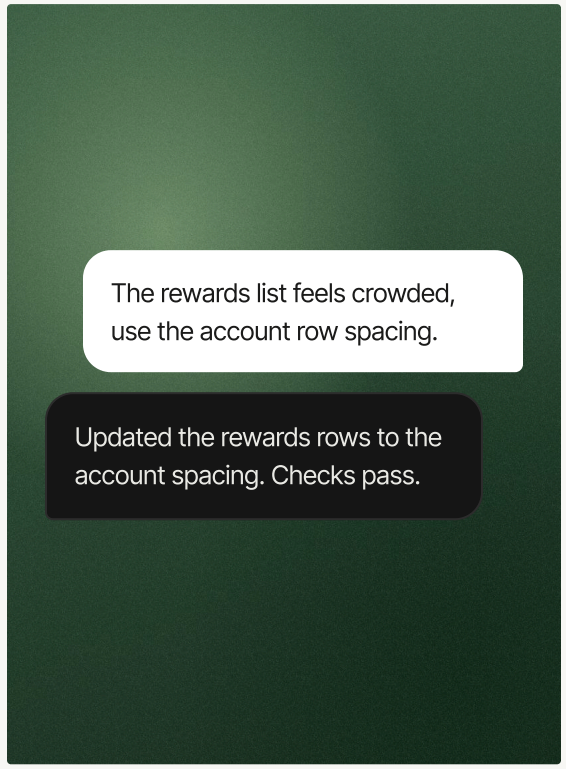

02 Answer

Claude researches, then asks 1–4 questions. Each has a recommended answer; pick it or say what you want.

03 Review

Open the page in the preview. Every screen has a URL; Claude also screenshots and checks each one.

04 Refine

Follow up in plain words, as many times as you need. Same files, same rules.

THEN SHIP `give me the handoff and push on a new branch`

`/noon-ui` `/home-page` `/search` `/pdp` `/cart` `/checkout` `/orders` `/returns` `/reviews` `/account` `/noon-one` `/noon-motion`

One prompt, one noon screen

Prompts in the shape that works best, and screens from the kit they lead to. Copy one, change the details.

PRODUCT PAGE

```
/pdp show the page for p7 and check its reviews and specs
```

RESTYLE

```
/cart restyle the shipment card to match @~/Desktop/cart.png
```

FROM FIGMA

```
/orders update order tracking to this frame: figma.com/design/…?node-id=…
```

NEW FEATURE

```
/search add recent searches and trending pills under the bar
```
